

How to Use Your Precision Chlorine Test Strips

Please post near your sink or dishwasher for easy reference.

How to Use Your Precision Chlorine Test Strips

- 1) Use dry fingers to remove a test strip from the vial.
- 2) Dip test strip into water and chlorine bleach solution for 1 second. Do not agitate the strip.
- 3) Immediately compare test strip with the colour label provided on the vial's chart.
- 4) The strip's colour indicates the concentration, or strength, of the chlorine bleach in the water. It is measured in parts per million (ppm).
- 5) The test strip should be at the colour level associated with 100 ppm. If the colour is too light you will need to add more chlorine bleach. If it's too dark you will need to add more water.
- 6) Retest with a fresh test strip.
